

The Data Protection Risk Game: paper version

How long can you stay in business, and which risks can you avoid?

Playtest version. Numbers in [square brackets] are recommendations to try out and to change. Boxes with a blue stripe are **optional rules**.

1. Introduction and goal

Monday morning, the coffee is hot, and you are ready to take on the world.

Every project arrives with a few ways to go wrong, but you got your measures ready, a purse of coins and a matrix that shows exactly how bad it looks. Your job is to push every risk out of the red, or even better into the green, before the launch date, because someone upstairs has already told the customers it is happening.

That someone is **management**. Management reads your risk assessment, nods slowly, and then does what it believes. The higher the risk you leave behind, the higher the chance that something goes wrong.

The goal. How long can you keep your business out of trouble, and which risks can you avoid? Bring every risk of a project below **High**, out of the red, spend your coins wisely, and make it through as many projects as you can. When the coins are gone, so is the business.

Who plays. Two or more teams play at the same time, each running their own business with their own matrices, cards and coins. One more person is the facilitator, who runs the game, plays management and does not run a business. A game is usually about [6] projects, about [45 minutes]. At the end, the teams still in business are ranked by coins left.

How hard is it? The facilitator decides how fat the purse is. They can add or remove some coins to balance things out.

2. Components

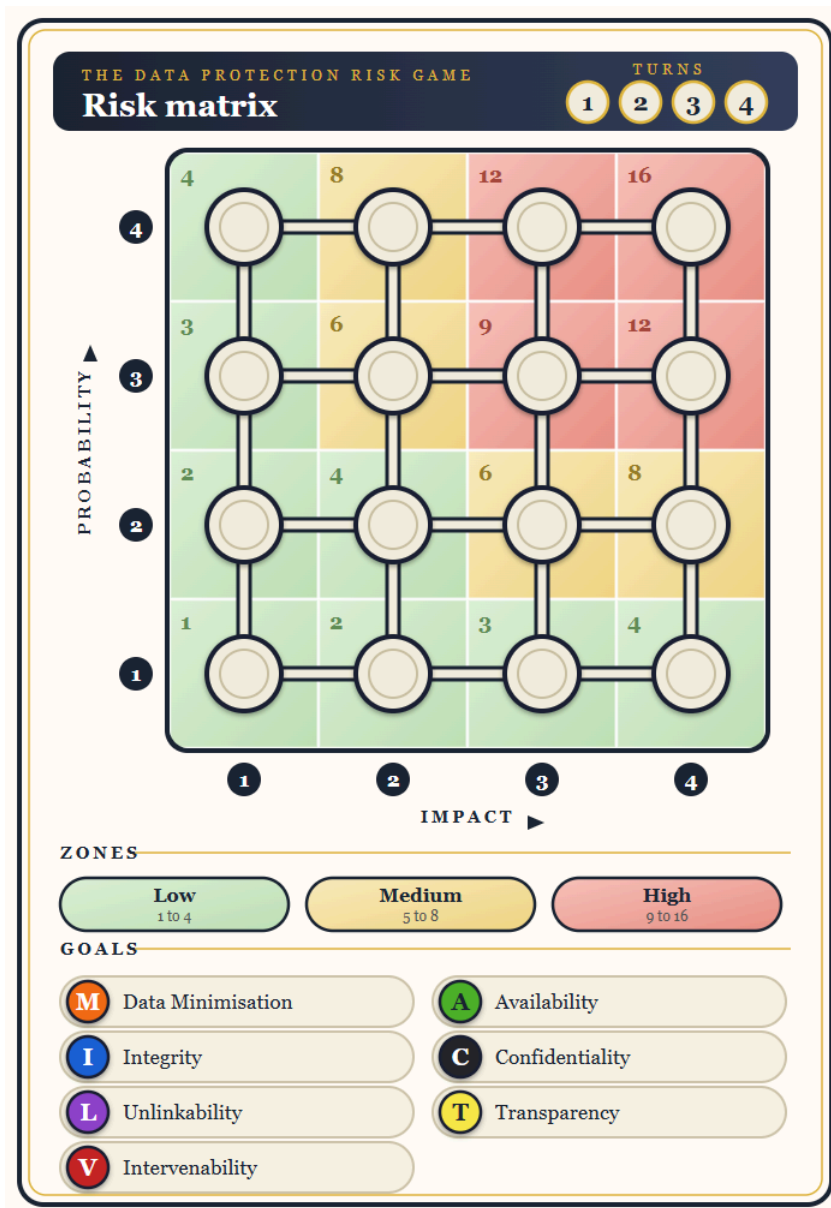

What is in the box, and what each part is for. Where it all goes comes in the setup.

- **Measure cards.** The cards you play to fight risks. They come in three colours.

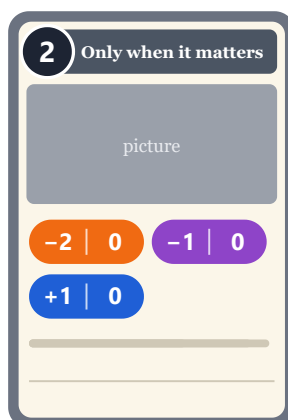

- **Risk cards.** The risks that land on a team's desk.
- **Event cards.** Things that happen along the way. EVO1 to EV10 come up twice as often, so they are printed twice and numbered EVO1.1 and EVO1.2, and so on: the event deck has 51 cards.

All three kinds are in one print file, [cards.pdf](#) (DIN A4, 3 × 3 cards a page with crop marks). Every second page is the back of the page before. The sheets are packed with nine cards each. The measure cards all have the same back, since they are one draw pile. The risk cards and the event cards each have a back of their own, in their own colour and shape, so you can sort them into their stacks after cutting. Print it double-sided, flipped on the long edge, and cut along the marks. The strategy cards are left out. There is a second file with text only and no pictures, [cards-text.pdf](#), which prints faster and uses less ink.

- **Risk matrices.** A stack of boards where a risk is fought ([PDF, DIN A4](#)). Each has a turn track (1 to 4) in its banner: put a coin on the number of the turn you are in.
- **Figures.** Three in the colour of each goal for each team, because the same goal can be on up to three matrices at once. They show where a risk stands on a matrix.
- **Coins.** What it costs to play a measure, and what keeps a business alive.
- **Dice.** A twenty-sided die (d20) for each team and one for the facilitator.
- **Player aid.** A one-page summary of the rules with pictures, one for each team ([page, PDF, DIN A4](#)).
- **Facilitator sheet.** The table of what goes wrong ([page, PDF, DIN A4](#)).

Reading a card and moving a figure

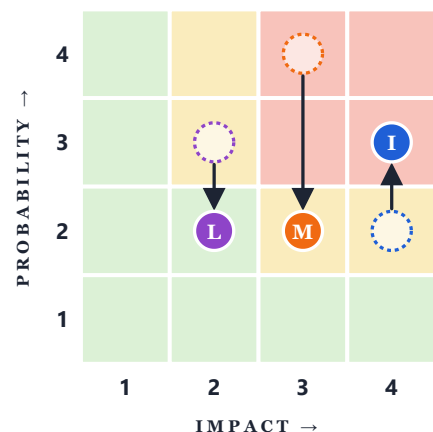

Dark circle, top left: the price in coins

left
probability
rows

right
impact
columns

– lowers: down or left (good)
+ raises: up or right (a downside)
0 stays

Dashed ring: where a figure was. Solid: where this card puts it.

The parts of a card, one by one.

Price
Dark circle, top left.
Pay these coins
when you play the card.

Blue card price
A second, small number:
the price when you play
it again later.

Frame colour
Grey: project.
Blue: shareable.
Yellow: central.

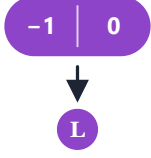

Left number
Probability: the rows.
Minus: it goes down.
Plus: it goes up.

+ up
- down

Right number
Impact: the columns.
Minus: it goes left.
Plus: it goes right.

- left + right

Goal colour
The circle's colour is
the goal. It moves the
figure of that colour.

Minus
Lowers it: good.
Left number: down.
Right number: left.

↓ ←

Plus
Raises it: a downside.
Left number: up.
Right number: right.

↑ →

Zero
Nothing moves on
this side. A figure stays
between 1 and 4.

L stays

The seven goals and their colours (the figures on the matrix)

 Data Minimisation
  Availability
  Integrity
  Confidentiality

 Unlinkability
  Transparency
  Intervenableity

A minus lowers the risk, a plus raises it. Think of it as the change to the number on the matrix.

On the card	What the figure does
Left number, -2	Probability goes down by 2: the figure moves 2 spaces down .
Right number, -1	Impact goes down by 1: the figure moves 1 space to the left .
Left number, +1	Probability goes up by 1: the figure moves 1 space up . This is a downside of the card.
Right number, +1	Impact goes up by 1: the figure moves 1 space to the right . This is a downside of the card.
0	The figure does not move on this side.

1. Look at the first circle and find the figure of its colour on a matrix.
2. Move it by the left number along the rows, then by the right number along the columns.
3. A figure never leaves the matrix: it stops at 1 at the bottom and left, and at 4 at the top and right.
4. Do the same for every other circle of the card, with its own colour.
5. Do all of it on **every matrix of the project** that has a figure of that colour. A risk without a figure of that colour is not affected.

A **risk card** shows, for each goal it threatens, the colour of the goal and two numbers: probability and impact. They are the space where the figure starts: the row is the probability, the column is the impact.

Why the numbers matter: the **row** of a figure decides the roll it needs at the end of the project, and its **column** decides what a failure costs (see the facilitator sheet). The red spaces on the matrix are the ones to leave.

3. Setup

The facilitator, before the game:

1. Shuffles the measure cards and puts them in the middle of the table as the **draw pile**, leaving room next to it for a **discard pile**.
2. Shuffles the **risk cards** into one stack and the **event cards** into another, and keeps both next to the draw pile.
3. Keeps the **facilitator sheet** and a **d20** at hand.
4. Lays a stack of **risk matrices** and the **figures** ready, where every team can reach them.

The facilitator, for each team:

5. Gives the team a **player aid** and a **d20**.
6. Gives the team its starting **coins**, [20] of them. The facilitator can add or remove some.
7. Deals the team [9] cards from the draw pile.

The teams:

8. Each team picks a **processing owner**. The processing owner holds the cards and the coins and coordinates with the rest of the team.
-

4. How the game is played

The structure

The game is played in **projects**, and a project has one or more risks. The teams play their turns at the same time, to bring the risks down before the time runs out after four turns. At the end of the project, each team rolls the dice and the facilitator checks whether something went wrong.

1. Start of a project

1. The facilitator pays each team [10] **coins**.
2. The facilitator turns over the risk cards of the project: [1] in the first project. *Optional, for experienced groups:* then [2], [2] and [3], and after that again [1], [2], [2], [3]. For beginners it is better to keep the number lower, for example one or two risks in every project. The facilitator makes up a bit of a story. Every team faces the same risks.
3. Each team takes a risk matrix for every risk and puts a figure on each starting space shown on the risk card.
4. Each team **turns its blue cards and its yellow cards upright** again (they lay sideways in the last project). They stay face up. This is also done after a bought DPO.
5. Now **every upright yellow card makes its moves**, once, on the matrices you have just put figures on, as if the card had just been played (a matrix that was moved by a bought DPO gets no more moves of blue and yellow cards). Then **turn the yellow card sideways** (see *Reading a card and moving a figure*).

2. A turn

In a turn every team has one **action**. A card that says "lose one action" costs the team a turn, and a card that says "gain one action" gives it an extra turn. Mark the turn you are in with a coin on the turn track of the matrix.

1. Every team does one of the following actions, all at the same time:
 - **Play a card:** the processing owner plays a measure card from the hand, pays its coins and moves the figures on the matrix (see *Reading a card and moving a figure* above). This ends the team's turn. The played card goes where its colour says:
 - **Grey (project):** onto the discard pile at once, and the team draws a new one.
 - **Blue (shareable):** the team lays it face up and turned sideways next to itself. A blue card can be played once per project: sideways means played in this project. It is still part of the hand and counts for the hand size. At the start of the next project the team turns its blue cards upright again (see part 1). They stay face up, which shows they were played before, so a replay costs the replay price: the small number on the card, which is the whole price (the card text says "extra cost" for the same number). A blue card that goes to the discard pile, by a swap or by a reset, is forgotten: next time it costs its full price again.
 - **Yellow (central):** face up on the table and turned sideways: sideways means its moves are made in this project. The team draws a new card and makes the moves of the yellow card right away. It stays on the table and keeps working in every later project: at the start of the next project the team turns its yellow cards upright again, and an upright yellow card means its moves are still to make (see part 1).

- **Swap cards:** the processing owner puts up to [5] cards from the hand on the discard pile (not the blue cards lying sideways) and draws the same number from the draw pile. It is free and ends the team's turn.
- 2. The facilitator draws an event card and reads it out. It affects all teams and does what the card says.

When the draw pile is empty, the facilitator shuffles the discard pile to make a new one.

Optional rule: explain it creatively. When a team plays a card, the processing owner explains, as creatively as they can, why this measure works perfectly here. The facilitator judges the explanation: a good reason earns the team 1 or 2 coins, a funny story that does not fit earns nothing.

Event cards that need a rule

- **A new goal joins** (EV40, EV41): the facilitator picks one risk card of the project at random. Every team takes, for that risk, the first goal in the order of the letters A, C, I, L, M, T, V that is not on its matrix yet, and puts the figure of that goal on probability 3, impact 3. The cards played before do not move it; the cards played from now on do.
- **Reset** (EV39): every card played in this project is gone, and so are all the yellow cards on the table: they go to the discard pile. The figures go back to their starting spaces, a new goal to 3 / 3. The coins stay spent.
- **Wing it** (EV38): every team takes three cards from its hand without looking, not the blue cards lying sideways, and plays them one after the other. This does not use any turn. A team that cannot pay for one of them ends its project.
- **End the project** (EV17): the project ends at once, and a team may still call in the DPO before everybody rolls.

3. End of a project

The project ends after the last turn (events can change the number of turns).

1. **Optional rule: call in the DPO, before the roll.** This comes first, before any team rolls. Only for a high risk: a team with a figure in the red may pay [1] coin and appoint a data protection officer (DPO). The DPO makes an argument to the facilitator why the project must be stopped. The facilitator rolls the d20 in secret and decides whether management buys it. This is decided in each case. If it does, the project moves to the next round: the team keeps its matrices and figures and gets another chance for mitigation, with the full number of turns, and has no roll and no check this time. Blue and yellow cards are not played on a project that was moved this way: only grey cards move the figures of its matrices. The project is extra to the new risks of the next round, and the new risks are revealed for all teams

as usual. The next round starts as usual, including the coins. The coin for the DPO is not refunded. If management does not buy it, the team goes on with the roll.

2. **Roll.** Each team rolls the d20 once.
3. **Check.** The facilitator checks the figures on the team's matrices. A figure fails if the roll is too low for its probability row (see the facilitator sheet).
4. **Pay.** For every failed figure the facilitator names the cost for its impact and makes up what happened. The processing owner pays. A team that cannot pay is out of business.

Optional rule. The team may instead make a convincing argument to management why it was not their fault, and management, played by the facilitator, may cover some or all of the fee. The facilitator may roll a d20 in secret as a guide: [10] or above means management is open to it, and a good argument beats a low roll.

5. **Next project.** If it was not the last project, the next one starts with part 1. There the teams turn their blue and yellow cards upright again.

5. End of the game and score

- The game ends after the last project, or for a team when its coins run out.
- Teams still in business at the end are ranked by coins left. A team whose coins ran out ranks below them, by the number of projects it lasted.

6. Player aid and facilitator sheet

The player aid and the facilitator sheet are one page each, with pictures, and are made to be printed on DIN A4.

- **Player aid**, one for each team: [page](#), [PDF](#). It shows the start of a project, the turn, the three card colours, the end-of-project roll, the matrix and how to read a card.
 - **Facilitator sheet**, for the facilitator: [page](#), [PDF](#). It shows the facilitator's jobs, the roll a team needs for each probability, the cost and the story for each impact, and the optional DPO.
 - **Trainer script**, for the person who trains facilitators: [page](#), [PDF](#), [DIN A4](#). A pretend play with two teams, fixed hands and fixed draws, one big page for every turn (made for a shared screen): the hand, the card that is played, what happens, and the figures and coins after it. Most rules of this book appear in it once; its last pages list where.
-

Appendix: an example project

Team Otter faces one risk. The black figure (Confidentiality) starts at probability 3, impact 3, in the red.

1. **Start.** The facilitator pays Team Otter [10] coins, turns over the risk card and tells a short story about it. The team puts the black figure on its starting space. Team Otter has no yellow card on the table yet, so there is nothing more to move.
2. **Turn 1.** Team Otter plays a grey measure card that lowers probability by one. The processing owner pays its coins, moves the black figure from probability 3 to 2 and puts the card on the discard pile. The team draws a new card. The facilitator draws an event card and reads it out.
3. **Turn 2.** The team plays a blue measure card that lowers impact by one. The black figure moves to impact 2: it is in the green now. The card lies face up and sideways next to the team, still part of its hand, and the team does not draw.
4. **Turns 3 and 4.** The team uses them the same way: it swaps cards in turn 3 and plays one more measure in turn 4.
5. **End.** Team Otter rolls its d20 and gets a 6. The black figure stands at probability 2, which needs an 8 or above, so it fails. Its impact is 2, so the cost is 4 coins. The facilitator tells the story, for example a customer complaint that goes to the authority, with lawyers and forms. The processing owner pays 4 coins. Had the roll been 9, nothing would have happened.
6. **Next project.** The facilitator pays Team Otter [10] coins, and Team Otter turns its blue card upright again.
